

GEOCHEMISTRY OF CHALK GROUNDWATERS IN ENGLAND AND FRANCE

EDMUNDS, W M, DARLING, W G, and KINNIBURGH, D G.

British Geological Survey, Wallingford, UK

DEVER, L.

Lab d'Hydrologie et de Géochimie Isotopique, Université de Paris-
Sud, Orsay, France

VACHIER, P.

Institut National de la Recherche Agronomique,
Thierval-Grignon, France

Cover photo: The Chalk cliffs of Dorset near Lulworth

CONTENTS

One Introduction	1
Stratigraphy of the Chalk	1
Stratigraphic subdivisions of the Chalk	00
Geochemistry of the Chalk	2
Chemical composition of the Chalk	2
Non-carbonate fraction	3
Carbonate geochemistry	3
Previous work on the hydrogeochemistry of the Chalk in England and France	3

Two The Soil Zone	5
Introduction	5
Soils	6
Porosity	6
Biological activity	6
Soil water chemistry	7
Isotopic composition	9

Three The Unsaturated Zone	10
Introduction	10
Water content	10
Water movement	12
Tritium	13
Stable isotopes	14
Chemical variation	16
Carbon isotopes	17
Conclusions	17

Four The Saturated Zone	20
Introduction	20
Hydrogeochemical changes along flow lines	20
Major ions and pH	20
Solubility controls	22
Exchange Reactions	23
Redox Reactions	23
Mixing	24
Trace element variations	24
Isotopic indicators of residence time, palaeowaters and evolution of groundwaters	25
Tritium	25
Oxygen and hydrogen stable isotopes	26
Carbon stable isotopes	26
Radiocarbon	27
Inert gas ratios	27
Uranium and products	27
Conclusions	27

Five Saline–Freshwater Interface	28
Introduction	28
Interstitial water profiles	28
The Trunch borehole	28
The Winterbourne borehole	29
The Faircross borehole	29
Origins of salinity in chalk groundwaters	30

Six Applications	33
Introduction	33
Summary of the principal water-rock interactions in the Chalk	33

Understanding flow in the saturated and unsaturated zones	33
Estimating recharge	33
What is the 'baseline' natural water chemistry and how can one recognise pollution	33
Potability and use of groundwater	34
How long has the water been in the aquifer?	35
How effective is the Chalk at buffering the effects of pollution?	35
Artificial recharge of the Chalk	33

- 30 Major ion variation along flow gradients across the Berkshire syncline.
- 31 Overall trends in the hydrochemistry of water in the Chalk (Berkshire).
- 32 Trends in redox potential and redox related parameters across the aquifer.
- 33 Hydrochemical and isotopic variation within the aquifer in the presumed flow direction in the Emmerin wellfield.
- 34 Relation between concentration and nitrate isotopic composition in the La Carmoye and Emmerin well fields.
- 35 Variations in trace elements along the line of flow.
- 36 Uranium, daughter isotopes and isotope ratios in groundwaters across the Berkshire Chalk.
- 37 Indication of groundwater residence time in the Berkshire Chalk.
- 38 Depth of chalk interstitial water chemistry from the Trunch borehole, Norfolk.
- 39 Variations with depth of $\delta^{18}\text{O}$ and δD relative to Na for interstitial waters from the Trunch borehole.
- 40 Depth profiles of Ca^{2+} , Mg^{2+} and Sr^{2+} for interstitial waters from the Trunch borehole.
- 41 Depth profile of chemistry of interstitial waters from the Faircross borehole, Berkshire.

- 42 Model of the water-rock interaction in the Chalk at microscopic scale.
- 43 Principal hydrogeochemical processes taking place along lines of flow in the Chalk.
- 44 Cumulative frequency diagram for fluoride showing the natural enrichment in the Chalk compared with other aquifers in the UK.

TABLES

- 1 Principal geochemical tools used in studies of the chalk and their applications.
- 2 Stratigraphic subdivisions of the Chalk.
- 3 Chemical composition of chalks from Beauval, Normandy.
- 4 Mean chemical compositions of the chalks in the Paris Basin.
- 5 Summary of data for studies shown in Table 6.
- 6 Main features of sites of unsaturated zone studies and related bibliography.
- 7 Mean annual rate of water percolation.
- 8 Mean annual recharge.
- 9 Features of groundwater flow in the saturated chalk.
- 10 Selected studies of the saturated zone in England and France.
- 11 Typical analyses of groundwater from the London Basin.

PLATES

- 1 SEM photomicrographs of chalk from the Faircross borehole (Field approximately $5\mu\text{m}$).
- 2 Soils derived directly from Chalk which inherit the pore structure of the parent chalk.
- 3 Soils with poorly drained argillaceous horizons which are susceptible to shrinkage and swelling and in which preferential flow of water may occur.
- 4 Composite soils similar to sandy soils with a large porosity.
- 5 Geochemical evidence of redox-reactions and water-rock interaction in the Upper and Middle Chalk.
